Anchor Rods - AISC Home

AISC has changed its terminology to anchor "rod" to eliminate confusion between structural bolting applications, such as those covered by the AISC and RCSC Specifications, and anchorage applications between steel members and concrete elements. This includes such issues as installed tension, slip resistance, and hole sizes, which do not apply in anchor-rod applications as they are covered for all-steel bolting applications.

engagement of anchor rod nuts. EVERY ANCHOR ROD has its limit. Here, we'll discuss the limit state of thread stripping in threaded steel anchor rods (anchor bolts), used with nuts, for diameters, D, from 0.5 in. to 4 in. Internal threads (nuts) or external threads (threaded rod) could strip under certain conditions. This limit state can usu-

ANSI/AISC 360-16: Specification for Structural Steel Buildings

A general rule of thumb is given in AISC Design Guide #10 Erection Bracing of Low-Rise Structural Steel Frames 1: the minimum thickness should be one-third the diameter of the anchor rod and that the minimum diameter (or length and width for a non-circular washer) should be 1-in. larger than the hole diameter. When the anchor rod transmits tension, the washer size must be sufficient to transmit the force to the base plate.

The ASTM specification allows F1554 anchor rods to be supplied either straight (threaded with nut for anchorage), bent or headed. Rods up to approximately 1 in. in diameter are sometimes supplied with heads hot forged similar to a structural bolt. Thereafter, it is more common that the rods will be threaded and nutted.
