Fundamentals of C-O bond activation on metal oxide catalysts

Mixed metal oxides are used as catalysts in the gas phase partial oxidation of hydrocarbons. This paper will present the principles of catalyst choice for selective oxidation reactions as well as the structural features of metal oxide catalysts. The nature of active sites in

Metal oxides excel at catalyzing gas phase reactions by photo-activation, as well as thermal activation of the catalyst. Oxidation of hydrocarbons, alcohols, carbon monoxide, and ammonia occurs when stimulated with light of greater energy than the band gap of the metal oxide.

Surface properties of transition metal oxides - Wikipedia

Metal oxides are occasionally used as a catalyst. Cheaper and more resistant to poisoning than precious metal catalysts, they are often less durable and efficient than noble metals. Non-noble metal based catalysts can be either supported or unsupported metal oxides, and are

At present, two types of catalysts, namely, noble metal catalysts and non-noble metal oxides, have been exploited for this purpose. Although transition metal oxide catalysts, and especially CoMn-based catalysts, have shown superior performance for HCHO oxidation [7], their activity at low temperatures ($<70\text{ }^{\circ}\text{C}$) is still quite low
