INTRODUCTION TO STEREOCHEMISTRY AND CONFORMATIONAL ANALYSIS

Stereochemistry- the arrangement of atoms in space. Conformational isomers- those that rapidly interconvert at room temperature; they cannot be separated. They result from rotation about C-C single bonds (and from inversion of the electron pair on nitrogen). Configurational isomers- separable isomers that do not readily interconvert.

Cyclohexane derivative stability is investigated using a combination of molecular modeling kits, conformational analysis, computational chemistry and polarimetry. Students build selected mono- and disubstituted cyclohexanes using model kits, predict the most stable conformation and calculate conformational equilibria. Students also construct cis-1,2-dimethylcyclohexane and trans-1,2 ...

For this class, we will always find that the most stable conformation is staggered (i.e., 1, 3 or 5), and the least stable is eclipsed (i.e., 2, 4 or 6). Comparing 1, 3 and 5, we see that 1 has two "bad" gauche interactions, whereas 3 and 5 have only one gauche interaction; thus 3 and 5 are both equally stable, and they are the most stable conformations for 2-methylbutane.

Conformational isomers exist in a dynamic equilibrium, where the relative free energies of isomers determines the population of each isomer and the energy barrier of rotation determines the rate of interconversion between isomers: $K = e^{-\Delta G^\circ / RT}$, where K is the equilibrium constant, ΔG° is the difference in standard free energy between the two conformers in kcal/mol, R is the universal gas ...

Just like how your left foot doesn't quite fit your right shoe, molecules also can have properties that depend on their handedness! This property is called chirality. We will go over what makes a molecule chiral, stereoisomers, assigning configurations using the R,S system, optical activity and Fischer projections.
