focuses the student's attention on the idea of seeking a solution of a differential equation by writing it as  $y' = f(x, y)$ , where  $y$  is a known solution of related equation and  $u$  is a function to be determined. I use this idea in nonstandard ways, as follows: In Section 2.4 to solve nonlinear first order equations, such as Bernoulli equations and nonlinear

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable  $x$ , its derivatives, and some given functions of  $x$ . The unknown function is generally represented by a variable (often denoted  $y$ ), which, therefore, depends on  $x$ . Thus  $x$  is often called the independent variable of the equation. The term "ordinary" is used in contrast with the term ...

Differential Equations. A Differential Equation is a n equation with a function and one or more of its derivatives:. Example: an equation with the function  $y$  and its derivative  $dy dx$  . Solving. We solve it when we discover the function  $y$  (or set of functions  $y$ ).. There are many "tricks" to solving Differential Equations (if they can be solved!).But first: why?

So the solution here, so the solution to a differential equation is a function, or a set of functions, or a class of functions. It's important to contrast this relative to a traditional equation. So let me write that down. So a traditional equation, maybe I shouldn't say traditional equation, differential equations have been around for a while.

A differential equation (de) is an equation involving a function and its deriva-tives. Differential equations are called partial differential equations (pde) or or-dinary differential equations (ode) according to whether or not they contain partial derivatives. The order of a differential equation is the highest order derivative occurring.
