In fluid dynamics, within the framework of continuum mechanics, a fluid parcel is a very small amount of fluid, identifiable throughout its dynamic history while moving with the fluid flow. As it moves, the mass of a fluid parcel remains constant, while—in a compressible flow —its volume may change.

1. Introduction. Small volumes of fluid trapped during crystal growth are referred to as primary fluid inclusions (Roedder, 1984). Microthermometric and chemical analyses of primary fluid inclusions are important sources of quantitative information on the temperatures of mineral formation and the chemical composition of parent fluids (Goldstein and Reynolds, 1994; Roedder, 1984).
