Most important congruence rules are concerning triangles, and they are used for congruence of almost all 2D shapes (quadrilaterals, hexagons...). There are 4 of these rules: 1) Side-Angle-Side (SAS) If 2 triangles have 2 equal sides and an equal angles that are between those sides, then we can conclude that these 2 triangles are congruent.

Determine whether the triangles are congruent. Explain your reasoning. It is given that $\angle AB \cong \angle AD$ and $\angle BAC \cong \angle DAC$. By the reflexive property of congruence, $\angle AC \cong \angle AC$. Since two sides and an included angle of each triangle are congruent, $\triangle BAC \cong \triangle DAC$ by the SAS Triangle Congruence Theorem. Module 5 267 Study Guide Review

A triangle that has two sides of equal length is called an isosceles triangle. We can get all sorts of isosceles triangles. There are acute isosceles triangles, obtuse isosceles triangles, and right isosceles triangles. They all have different angles, but since isosceles refers to sides only, they're all equal in terms of their isosceles-ness.

When two triangles are congruent, they're identical in every single way. Sure, they might be flipped or turned on their side or a million miles away, but they're still clones of each other. If two triangles are congruent, then we should be able to perform only congruence transformations in order to map one triangle onto the other.
